

# Data Intake Report

Name: Deployment on Flask

Report date: August 31st, 2023

Internship Batch: LISUM 24

Version:<1.0>

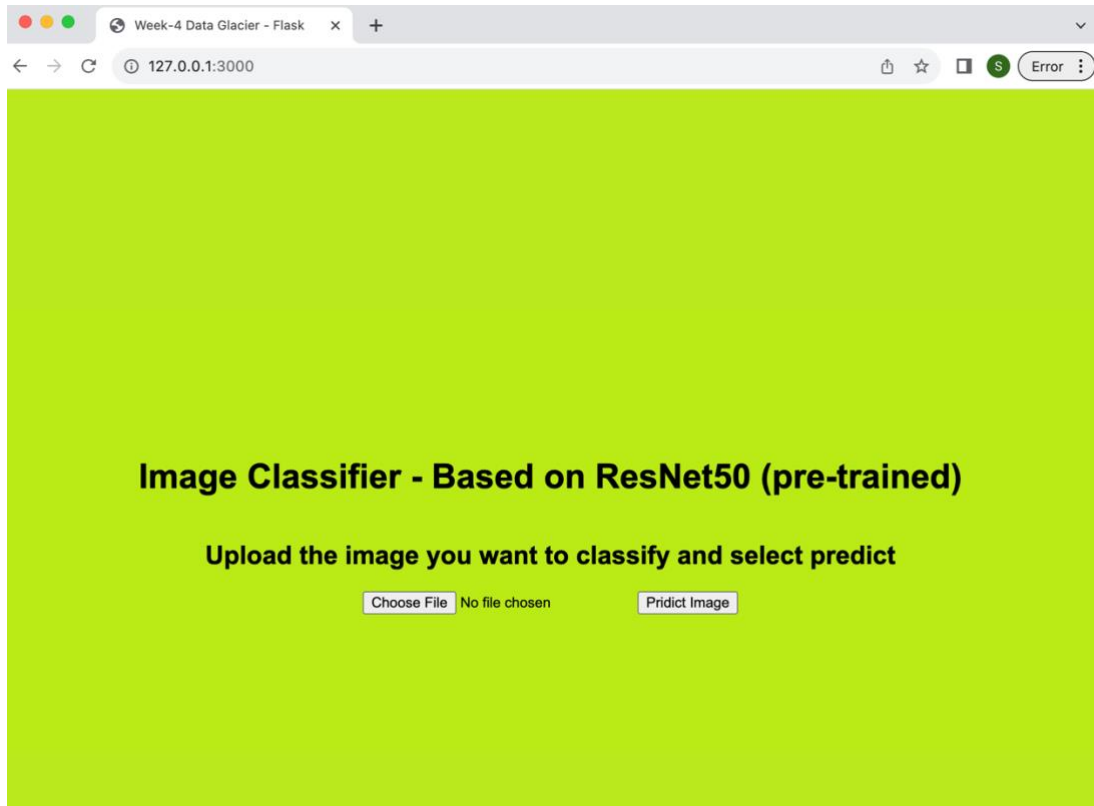

Data intake by: Shreya

Data intake reviewer:

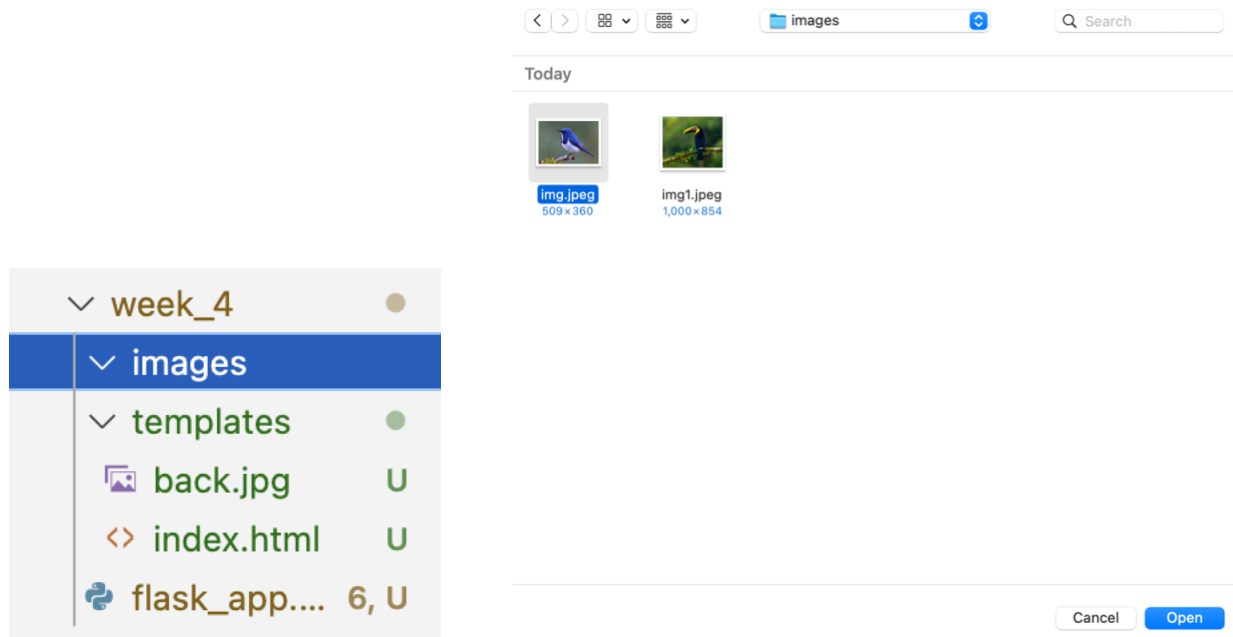

Data storage location: github

## Proposed Approach:

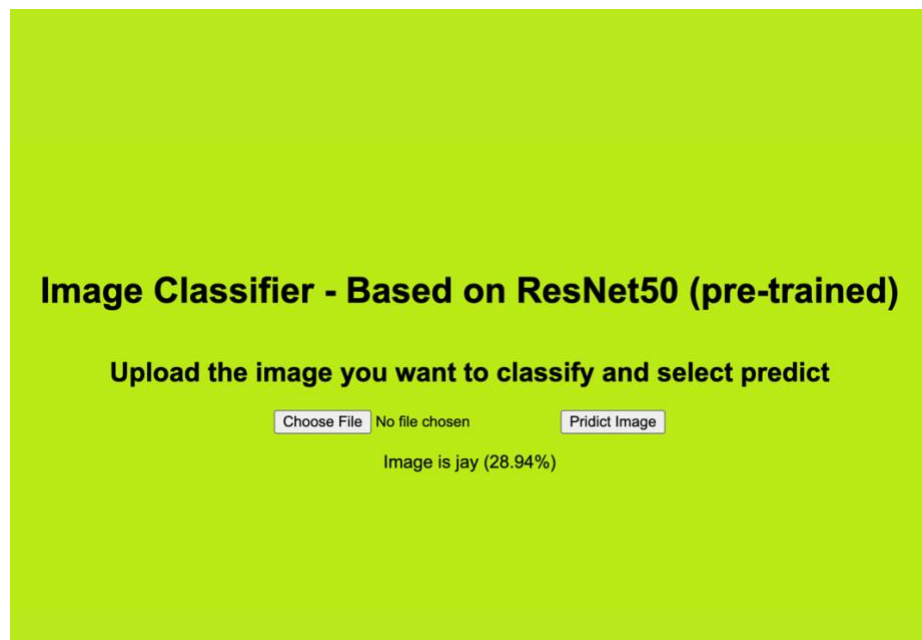

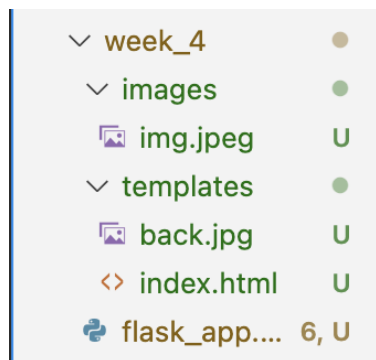

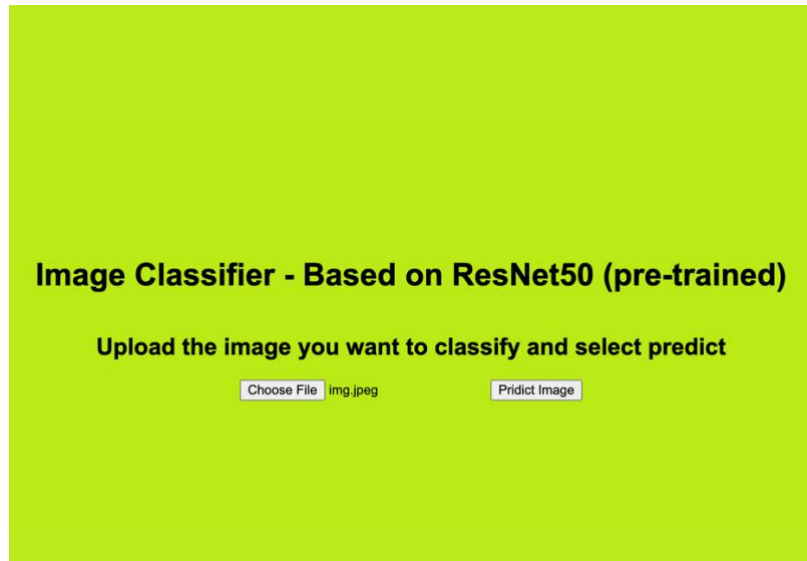

- First, I have selected to go ahead with a pre-trained model for the use case of image classification. Hence, I chose ResNet50 which is available in Keras.
- To deploy the model using Flask, the following files are needed:
  - Html file containing template for web hosting.
  - Python file containing code of model and flask interface.
  - Folder to store images.
- The code of Html and model has been uploaded along with the document.
- After running the code using - python flask\_app.py the application begins.
  - \* Serving Flask app "flask\_app" (lazy loading)
  - \* Environment: production  
WARNING: This is a development server. Do not use it in a production deployment.  
Use a production WSGI server instead.
  - \* Debug mode: on
  - \* Running on http://127.0.0.1:3000/ (Press CTRL+C to quit)
  - \* Restarting with watchdog (fsevents)
- We can copy paste the above URL to go to the webpage. And the following page is displayed.

- Now we can go ahead with the task of uploading any image and our pertained ResNet model will make a prediction.

- Further the image we (the user) upload will be stored into the folder we created before.

- And the prediction is displayed. The process continues for other images as well.

## Image Classifier - Based on ResNet50 (pre-trained)

Upload the image you want to classify and select predict

Choose File

No file chosen

Pridict Image

Image is toucan (98.98%)
