## 1 Week 4: Model Deployment on Flask by Connor Bryson

- 1.1 Here is the code for my python model with Flask Set up
- 1.2 I chose a Random Forest Regressor for the data and the data came from the Kaggle Titanic Machine Learning Competition
- 1.2.1 The model predicts the probability of survivability based on number of siblings and parch.

```
[]: # # -*- coding: utf-8 -*-
                                 # """
                                # Created on Fri Sep 22 14:32:59 2023
                                 # @author: cdbry
                                 # """
                                # import numpy as np
                                # import pandas as pd
                                 # from flask import Flask, request, render_template
                                 # from sklearn.ensemble import RandomForestRegressor
                                \# train data = pd.read csv(r"C: \Users \cdbry \Desktop \Data Glacien_1

                                         →4\Deployment_Flask\data/test.csv")
                                 # app = Flask( name )
                                # y = train_data["Survived"]
                                 # features = ["SibSp", "Parch"]
                                 # X = pd.qet_dummies(train_data[features].dropna(how ='any'))
```

```
# model = RandomForestRegressor(n estimators=100, max depth=5, random state=1)
# model.fit(X, y)
# @app.route('/')
# def home():
     return render template("template.html")
# @app.route('/predict', methods = ['POST'])
# def predict():
#
     For rending results on HTML GUI
#
     int_features = [int(x) for x in request.form.values()]
     final_features = [np.array(int_features)]
     prediction = model.predict(final_features)
     return render_template('template.html', prediction_text = f"Probability_
 # if __name__ == "__main__":
     app.run(port = 5000, debug = True)
```

# 1.3 Next I made the templates folder for the html template and put it with the model

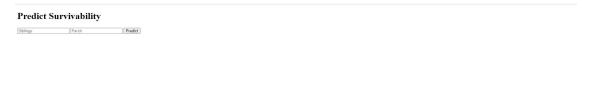

### 1.4 Then I made the html template which is shown below

```
[]: # <!DOCTYPE html>
    # <html >
    # <!--From https://codepen.io/frytyler/pen/EGdtg-->
    # <head>
    # <meta charset="UTF-8">
    # <title>My Machine Learning API</title>
    # <link href='https://fonts.googleapis.com/css?family=Pacifico'usrel='stylesheet' type='text/css'>
    # <link href='https://fonts.googleapis.com/css?family=Arimo' rel='stylesheet'ustype='text/css'>
# <link href='https://fonts.googleapis.com/css?family=Hind:300'ustrel='stylesheet' type='text/css'>
```

```
# link href='https://fonts.googleapis.com/css?family=Open+Sans+Condensed:300'u
→rel='stylesheet' type='text/css'>
→ } } ">
# </head>
# <body>
     <div class="Login">
     <h1>Predict Survivability</h1>
     <!-- Main Input For Recieving Query to our ML -->
     <form action="{{ url_for('predict')}}" method="post">
         <input type="text" name="SibSp" placeholder="Siblings"_</pre>
⇔required="required" />
         <input type="text" name="Parch" placeholder="Parch"_</pre>
⇔required="required" />
         <button type="submit" class="btn btn-primary btn-block_</pre>
⇔btn-large">Predict</button>
    </form>
     <br>>
     <br>>
     {{ prediction_text }}
# </div>
# </body>
# </html>
```

# 1.5 Below are screenshots of the end product
